ARC ID - 6643 PO Receipts by File

Arturo Almaguer, March 2022

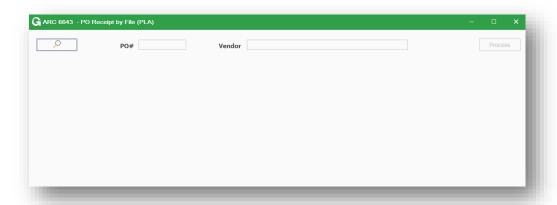

Customer: Voestalpine Corp

Business Case: Customer is looking to have the ability to process an EDI text file and then create a PO receipt with the processed data.

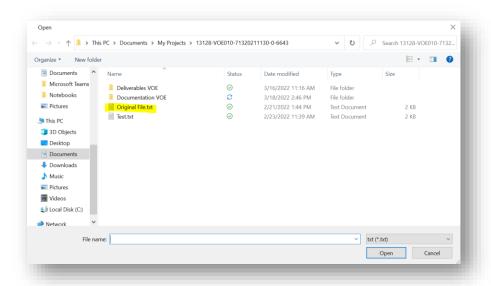

This project is launched off a new custom menu item created under Shipping & Receiving > Transactions > ASM EDI Receiving [6643].

Project's step by step

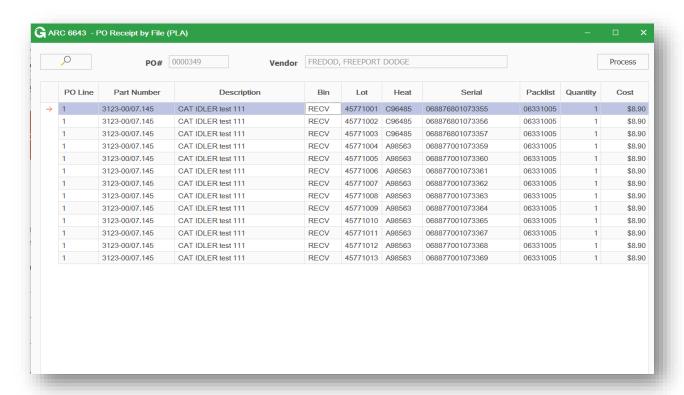

1. After the user clicks on the new custom menu item, an empty grid will be displayed.

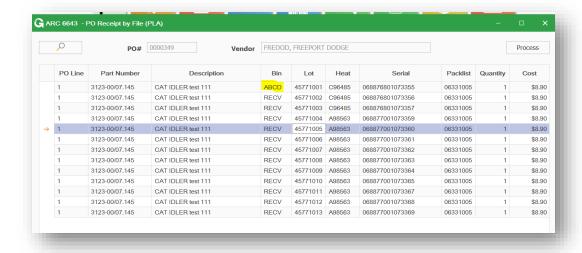

2. Once the user clicks on the browser button, they would be able to browse and select the text file they want to process.

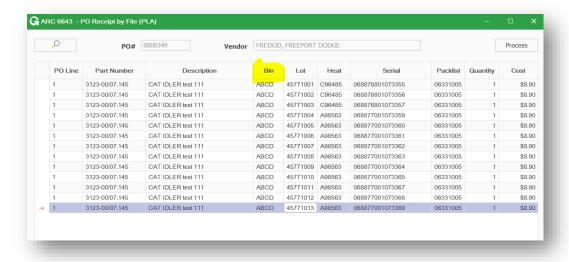

- 3. All the processed records will be displayed once the file has been processed. Information shown includes PO Line, Part Number, Part Description, Bin, Lot, Heat, Serial, Packlist Number, Quantity and Cost.
 - At the top of the screen, the PO number and both the vendor id and vendor name will be shown just as reference.
 - o Lot numbers get generated by taking into consideration the last lot number.
 - Advanced inventory 'Auto Number Lots in Receipts and WIP to FG' option must be turned on.
 - Bin column's default value is RECV.

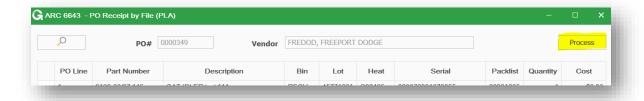

• 'Bin' is the only editable column to give the user the ability to change the default bin location to a new one. A context menu has been added to update the new bin to all other records.

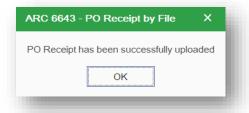

• The user will need to update the top record value to the new bin location, right click, click on 'Apply All', and then all records will have the new bin's value.

4. Once the user has validated all the information, they would need to click on 'Process' button in order to create the PO receipt.

5. A message box will be displayed to let the user know that the receipt has been successfully uploaded.

6. After the user clicks on the message box's OK button, the PO Audit Trail prompt will be shown to give the user the ability to print the PO Audit Trail if necessary.
